

CITY OF CAPE TOWN & SABITA

PROGRESS OF THE GREY WATER STUDY

32nd ROAD PAVEMENT FORUM

CSIR INTERNATIONAL CONVENTION CENTRE

7-8 NOVEMBER 2016

WELCOME AND INTRODUCTION

Presenter

- André Greyling
- Clients
 - SABITA & CITY OF CAPE TOWN
 - Represented by:
 - Ian Bowker
 - Saied Solomon

WELCOME AND INTRODUCTION

Grey Water Study Group

- MyCube Asset Management Gerrie Van Zyl
- University of Stellenbosch Kim Jenkins
 - Riaan Briedenhann
 - Marais Nel
- BVi Consulting Engineers André Greyling
- Zebra Surfacing Jonathan Pearce

WELCOME AND INTRODUCTION

Special thanks to

- Much Asphalt
- More Asphalt
- Colas

PRESENTATION OVERVIEW

- Section 1 Mew Way condition overview
- Section 2 Literature Review
- Section 3 Laboratory Testing Phase 1
- Section 4 Laboratory Testing Phase 2
- Section 5 Trial Section Monitoring
- Section 6 Conclusions & Recommendations

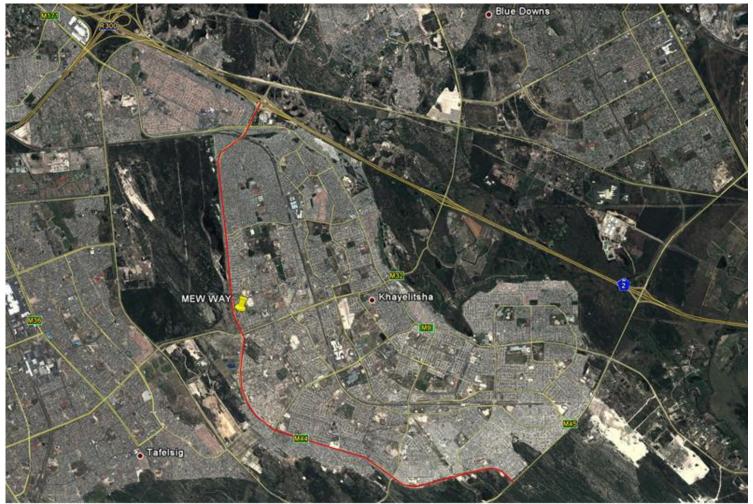

PROJECT LOCATION

- Specific Focus on Mew Way
- City of Cape Town Metropolitan Area
 - Khayelitsha Area
 - Includes various other roads in Informal Settlement Areas
- Found that roads & especially surfacing's just don't last in grey water contact areas
- TCT therefore identified the need for a more sustainable solution..

PROJECT LOCATION

SECTION 1

MEW WAY CONDITION OVERVIEW

January 2014

GREY WATER ON MEW WAY

STANDPIPE & ROAD DAMAGE

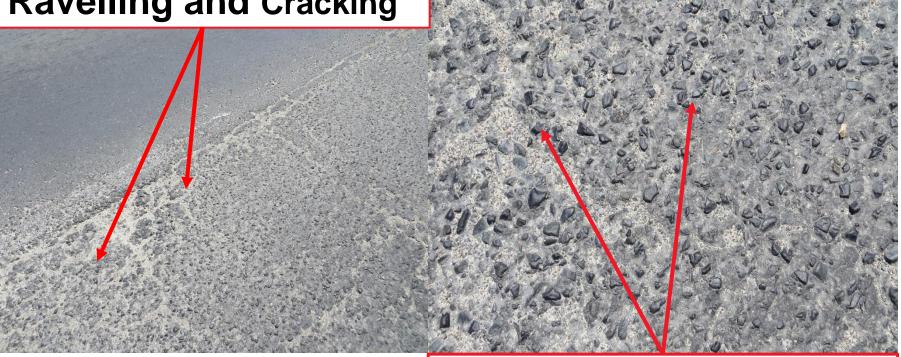

SURFACING DISTRESSES

Ravelling and Cracking

Loss of Filler & Small **Fractions**

FAILURE MECHANISMS

- What did we find?
- Identified failure mechanisms
 - Mastic , Stone and Bitumen Loss
 - (Adhesion & Cohesion)
 - Ravelling
 - Cracking
 - Patches
 - Pavement Failure

OUTCOME

- Confirmed the issue was real !
- Solution was however not as simple
 - Move the standpipes...
- Identified a three phased approach
 - Short term <u>Asphalt</u> solutions
 - Medium term Design & pavement solutions
 - Long term Training and education
- Focus of this study was the asphalt solution
- First step was an in-depth literature review

SECTION 2

LITERATURE REVIEW

WHAT IS GREY WATER?

- Grey Water General Definition:
 - "grey water is defined as the wastewater from bath tubs, showers, washbasins and washing machines" – NO Black Water
- Most important ingredient is Water
- Havellynn Peterson Thesis Door to Door Survey in the Mew Way Areas
 - Findings Water, Washing Powder, Dishwashing Liquid

GREY WATER CONSTITUENTS

- The Major Ingredients of Washing Powder and Dishwashing Liquids are Surfactants
- "Surfactants can be defined as a compound that lowers surface tension (or interfacial tension) between two liquids or between a liquid and a solid."
- Conclusion Grey Water consist of :
 - 99% + Water
 - Dissolved Surfactants
 - Various other less concentrated ingredients

FAILURE MECHANISMS

- Moisture/water damage as a starting point to understand the effect of grey water damage on asphalt.
- The major failure mechanisms *Disbonding or Adhesion Failure.*
- This occurs when there is a break in the bitumen/aggregate bond leading to:
 - stripping, ravelling, loss of stiffness and strength and other adhesion related failures.

CHEMICAL RESISTANCE OF ASPHALT

- Various Literature Sources on Chemical Damage to Bitumen (Not Asphalt)
 - Most Bitumen binders and Aggregates are not negatively influenced by Surfactants.
 - Soap does not generally dissolve bitumen or aggregates
 - The nature of Surfactant is however to Break
 Bonds and there is an expected influence on the Bitumen Aggregate Bond

FACTORS THAT WILL INFLUENCE MOISTURE DAMAGE

sabita

- Aggregate Properties
 - Basic for improved adhesion
- Bitumen Properties
 - Modification increase adhesion & chemical resistance (EVA& SBS)
- Asphalt Mixture Properties
 - Continuously graded , Active Filler (Lime)
- External Factors
 - Compaction, layer thickness etc

THEORETICAL SOLUTION

- Continuously Graded Mixture
- Asphalt designed to have 2.5% Voids post traffic compaction
- 1-3% Hydrated Lime as filler
- EVA or SBS Polymer Modified Binder to ensure increased strength and adhesion characteristics
- F-T Wax as compaction agent and to increase chemical resistance.

THEORETICAL SOLUTION

- Constructed Field Void Content of less than 7%
- Layer thickness of more than 40mm
- These finding was used as the basis for the development of the laboratory testing plan

SECTION 3

PHASE 1 LABORATORY RESULTS

Mr Riaan Briedenhann

- Tests conducted at Stellenbosch University
- Various asphalt and binder combinations
- Continuously Graded and Gap Graded mixtures
- Initial tests briquettes was soaked in clean water and grey water – ITS Tests
- Further testing was then completed using the Moisture Inducing Testing Device (MIST)
- Retained ITS values

Conclusions:

- Water versus Grey Water
 - Clean water damage of asphalt is significant
 - Grey water significantly increases this damage
- Composition
 - Continuously graded mixture performed best
 - Laboratory manufactured Semi Gap graded showed good potential

Binder Additives

- Additives shown definite increase in grey water resistance
- Plastomer (EVA) performed better that elastomer (SBS)
- Addition of SASOBIT increased compactability and showed increased resistance to grey water
- Addition of 2% lime proved beneficial in certain mixes

Compaction

Samples with less voids showed increased resistance to grey water damage

Conclusion and Recommendations

- Performance based tests required
 - MMLS
- Investigation into additional gradings and availability of local supply

SECTION 4

PHASE 2 LABORATORY RESULTS

Mr Marais Nel

- Expand test matrix More gradings and binder combinations
- Two grading groups
 - · Colto Medium (CM)
 - Higher volume roads
 - · Colto Fine , CCC Fine & Semi Gap Graded (FM)
 - Lower volume roads

- Two staged approach
- Stage 1- Initial Investigation
 - MIST & ITS

Stage 2 – Accelerated Pavement Testing

• MMLS3, Laser Profilometer & ITS

- MIST conditioning Clean and grey water at 60°C
- MMLS3 trafficking 100 000 dry and wet load cycles at 40°C
- Grey water concentration 0.5% Sunlight[®] liquid + 0.5% OMO[®] laundry detergent per 100 litres of clean water

- Phase 2 laboratory results included:
 - ITS (Strength, Stiffness)
 - TSR (Moisture susceptibility)
 - Permanent Deformation (Shear resistance)
 - Texture and Material Loss (Ravelling)

- Results were combined though simple rating criteria
- Determine effective grey water resistant asphalt mixture for:
 - High volume roads (Mew Way) Medium graded asphalt
 - Low volume roads (Internal roads) Fine graded asphalt

Asphalt Mixture & Grading	Phase 1			Phase 2					
	Compact -ability	TSR %	Average	Compact - ability	TSR %	Rut Dry	Rut Wet	Ravelling	Average
EVA + 2% Lime + 1% Sasobit® + ZycoTherm® – CM	1	1	1	4	5	1	2	1	2.6
EVA + 2% Lime + 1% Sasobit® - CM	2	3	2.5	1	2	6	3	2	2.8
EVA + 2% Lime – CM	4	5	4.5	3	4	2	1	7	3.4
SBS + 2% Lime – CM	3	4	3.5	2	1	5	7	6	4.2
SBS + 2% Lime + 1% Sasobit® + Polyamine – CM	5	2	3.5	7	6	3	4	4	4.8
SBS +2% Lime + 1% Sasobit® + ZycoTherm® – CM				6	3	4	6	5	4.8
SBS + 2% Lime + 1 % Sasobit® - CM	6	6	6	5	7	7	5	3	5.4
50/70 +1% Lime – CM	7	7	7	5	8	8	8	8	7.4

PHASE 2 LABORATORY RESULTS EVALUATION OF RESULTS – CM

- Based on simple performance position score:
 - EVA modified binder, 2% Lime, 1% Sasobit and 0.1% Zycotherm
 - EVA modified binder, 2% Lime and 1% Sasobit
 - EVA modified binder and 2% Lime

PHASE 2 LABORATORY RESULTS EVALUATION OF RESULTS – CM

 The range of EVA modified mixtures outperformed both the SBS and unmodified mixtures, whilst the 50/70 penetration grade binder showed the least resistance to grey water

PHASE 2 LABORATORY RESULTS

EVALUATION OF RESULTS - FM

]	Phase 1							
Asphalt Mixture & Grading	Compact -ability	TSR %	Average	Compact - ability	TSR %	Rut Dry	Rut Wet	Ravelling	Average
EVA + 1% Sasobit® + 0.1% ZycoTherm® - CF				2	3	1	1	1	1.6
EVA + 1% Sasobit® - CF	6	2	4	3	2	3	2	2	2.4
50/70 + 1% Sasobit® - CF	3	3	3						
50/70 + 1% Sasobit® - CCC	2	5	3.5						
50/70 + 0.07% ZycoTherm® - Much Fine	9	1	5	8	1	5	5	3	4.4
50/70 - CCC	4	7	5.5	4	6	4	4	4	4.4
50/70 + 1% Lime + 0.1% ZycoTherm® - CF				1	5	7	7	5	5
EVA + 1% Sasobit® - CCC	5	6	5.5	7	7	2	3	6	5
50/70 + 1% Lime - CF	1	8	4.5	6	4	6	6	7	5.8
50/70 + 1% Lime - CCC	8	4	6						
50/70 - Semi Gap	7	9	8						

PHASE 2 LABORATORY RESULTS EVALUATION OF RESULTS – FM

- The COLTO continuously fine graded asphalt with EVA modified binder, 1% Sasobit and 0.1% Zycotherm as additives
- The COLTO continuously fine graded asphalt with EVA modified binder, 1% Lime and 1% Sasobit as additive

SECTION 5

TRIAL SECTION MONITORING

TRIAL SECTION MONITORING

- Mew Way Rehabilitation
 - Completed in September 2014
 - GIBB
 - Various trial sections was constructed
 - Ideal opportunity to monitor in service behaviour

TRAIL SECTION MONITORING

- Visual Assessment
 - March 2016
- Mechanical Measurement
 - IRI
 - Rutting
 - Texture

VISUAL ASSESSMENT - 50/70 PEN GRADE

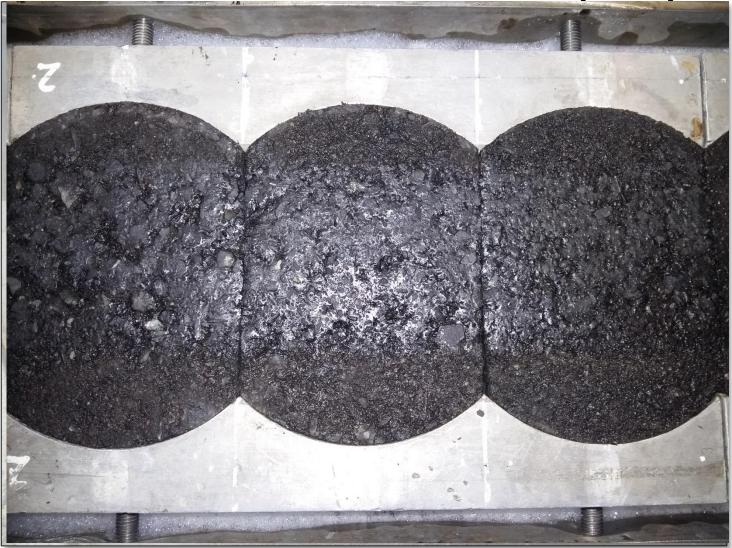

VISUAL ASSESSMENT – AE-2 (SBS)

VISUAL ASSESSMENT – AP-1 (EVA)

VISUAL SURVEY RESULTS

VISUAL SURVEY RESULTS

- Road still in good/fair condition
 - Expected after 2 years
- Texture/Material loss noted on all sections except A-P1 (EVA)
 - Already loss of material is visible

MECHANICAL MEASUREMENTS - TEXTURE

SECTION 6

CONCLUSION

CONCLUSION

- Found that EVA modified mixtures with a combination of additives performed the best
- Clear benefit of adding 1% SASOBIT® as compaction agent
- Zycotherm Nano Technology showed improved resistance to Grey Water damage

CONCLUSION

- Influence of gradings, voids, lime etc. confirmed
- Results further confirmed by in-service behaviour
- Confident that we have found a workable short term solution

WAY FORWARD

- Entering final phase of project
- Final recommendations and presentation to City of Cape Town on the 21st of November 2016
- Continuous monitoring of trial sections for another
 2 years up to 2018

QUESTIONS & DISCUSSIONS

THANK YOU
